EXTENSION ACTIVITY
INTRODUCTION TO COLLEGE CHEMISTRY

RADII TRENDS

Activity Directions

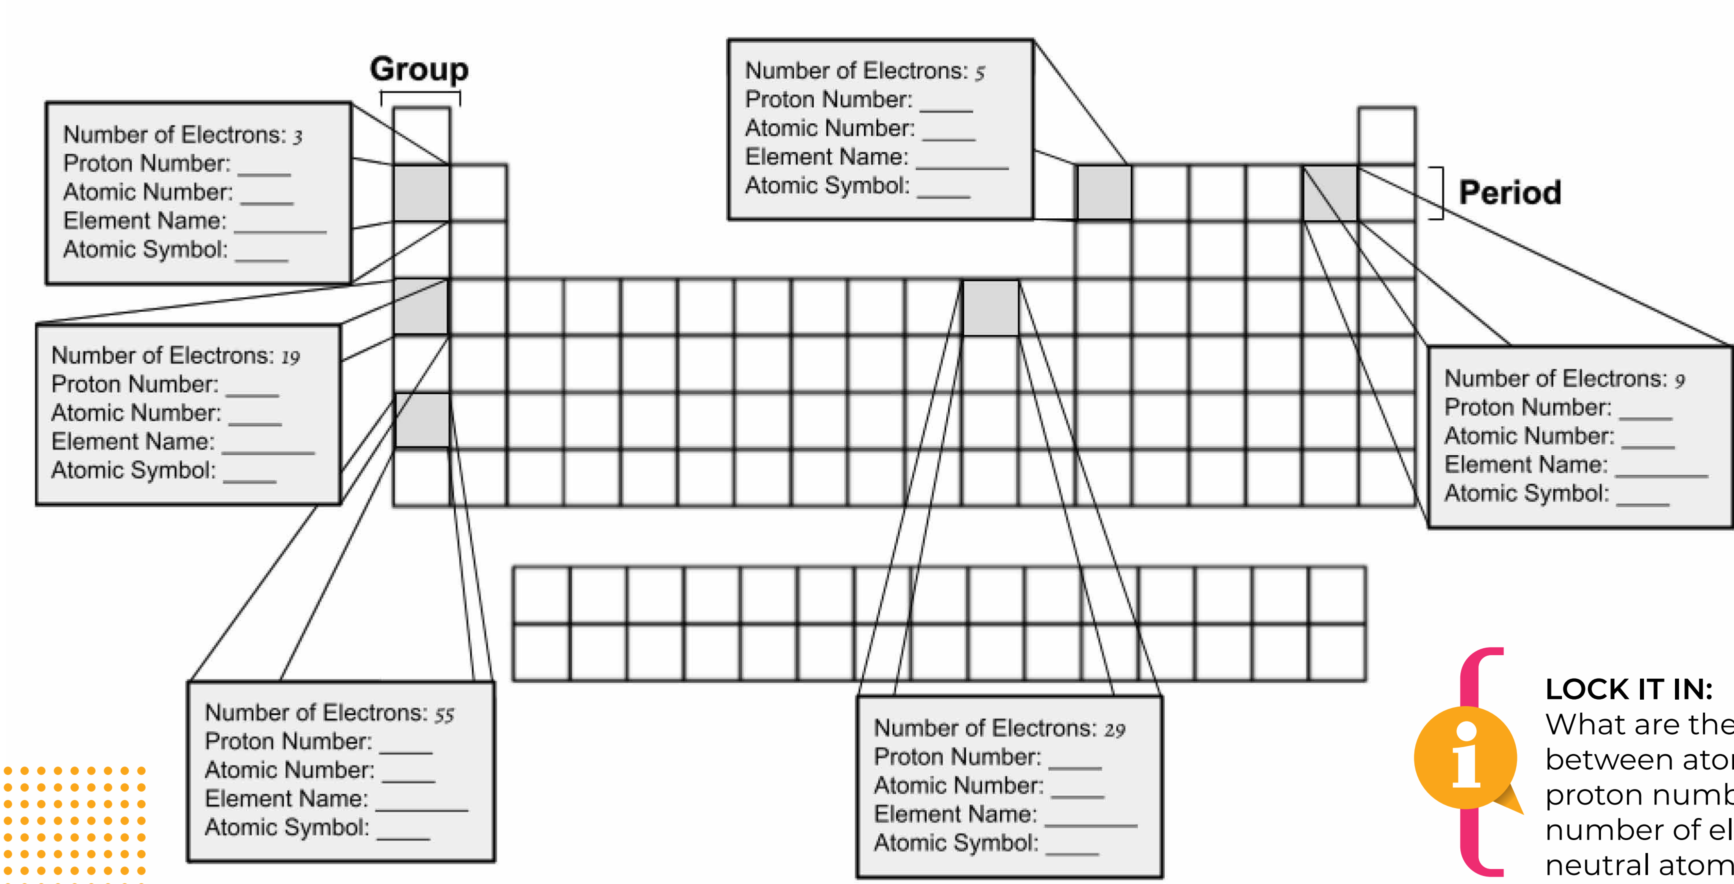
This activity will serve as practice for the topics covered in the first tutorial level, as well as help you connect those concepts to the periodic table. This activity is best used in conjunction with not only the tutorial levels, but also supplementary learning resources such as course lectures, textbook reading, etc. The goal of this activity is to use atoms you build in the sandbox to explore missing parts of periodic tables and identify periodic table trends. You will frequently be asked to “Lock It In”. These are simply opportunities for you to solidify what you have accomplished in each task and help ensure you meet each objective.

1. Log into Collisions and navigate to the Radii Trends Game.
2. Play the Tutorial levels, if you haven’t done so already.
3. Exit the levels and enter the Radii Trends sandbox.
4. Follow all instructions as written below. Be sure to reference your course’s textbook, lecture notes, etc. as needed.

OBJECTIVE 1

Demonstrate an understanding of the relationship between atomic number, proton number, the number of electrons, and the way these numbers increase on the periodic table.

TASK 1: For each of the elements indicated on the periodic table below, build the correct atom in the sandbox with the given number of electrons and then complete the missing data in the gray box.

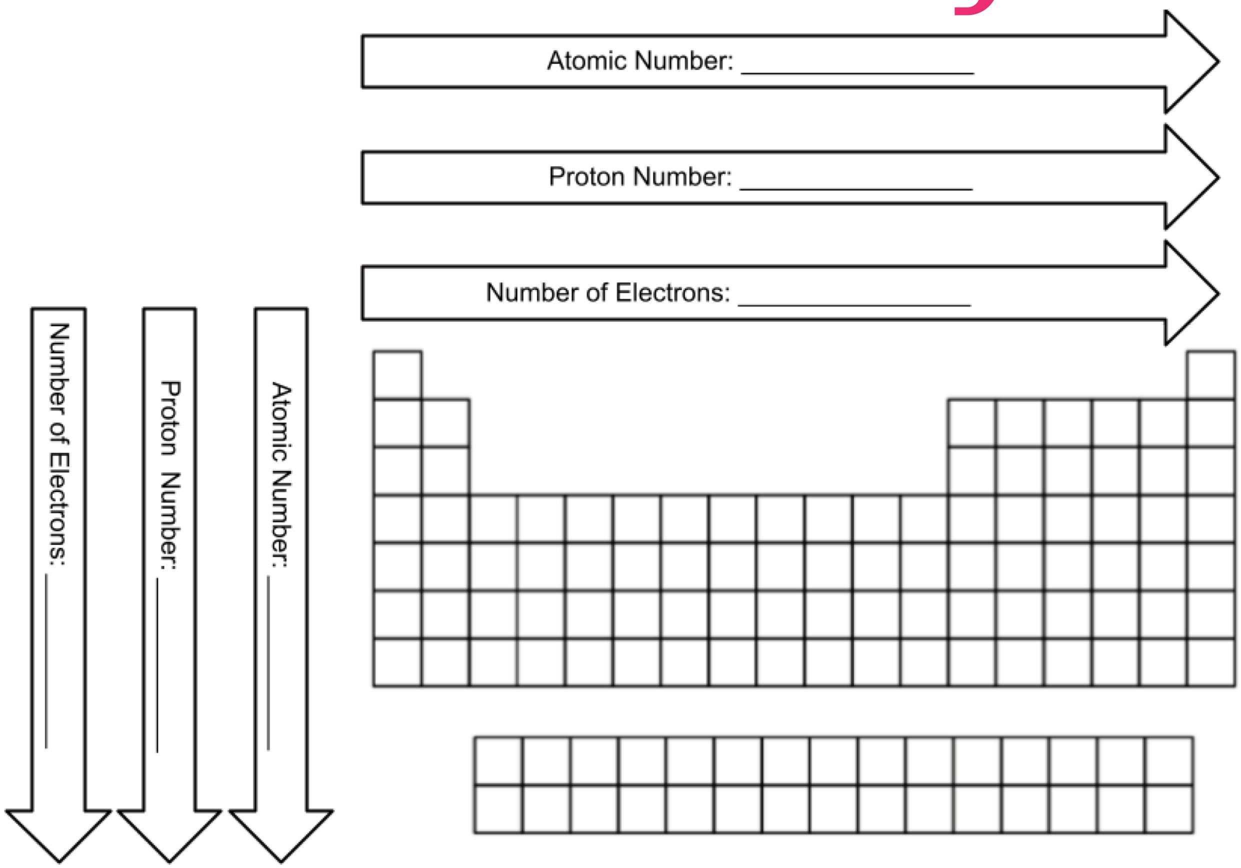


LOCK IT IN:
What are the relationships between atomic number, proton number, and the number of electrons in a neutral atom?

OBJECTIVE 1

Demonstrate an understanding of the relationship between atomic number, proton number, the number of electrons, and the way these numbers increase on the periodic table.

LOCK IT IN:
Identify the relationship between atomic number, number of protons, and the number of electrons in a neutral atom as you go right across a period and down a group by filling in the arrows below with the terms “increasing” or “decreasing”.



OBJECTIVE 2

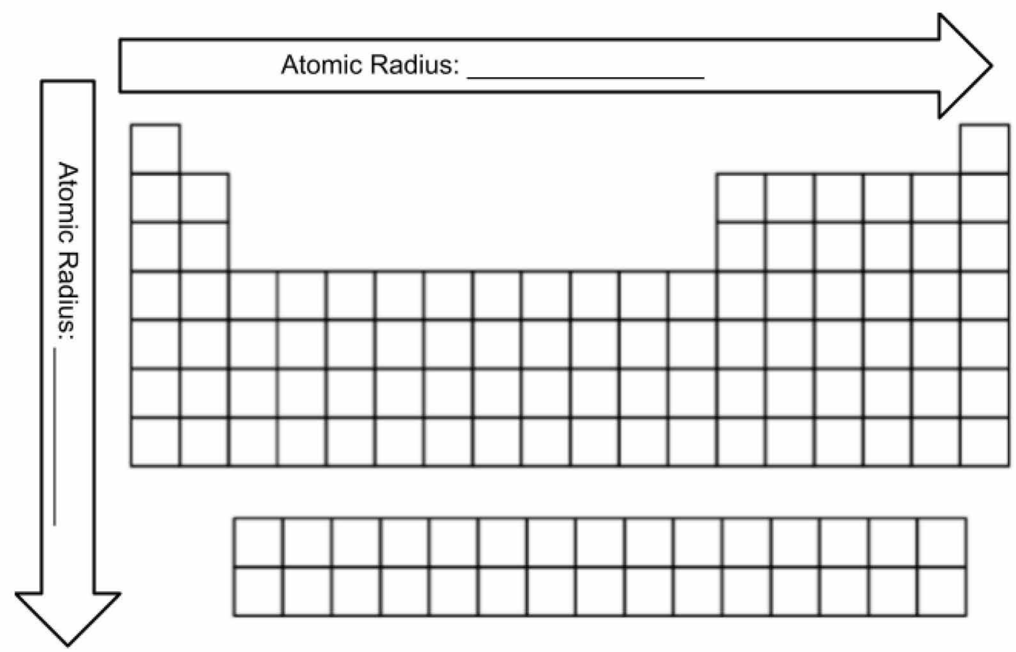
Demonstrate an understanding of how effective nuclear charge determines trends in atomic radii.

TASK 2: Take a look at the six original atoms that you made in the sandbox. Order these six elements in order of increasing atomic radius in the spaces below.

________ < ________ < ________ < ________ < ________ < ________

Smallest Radius ... Largest Radius

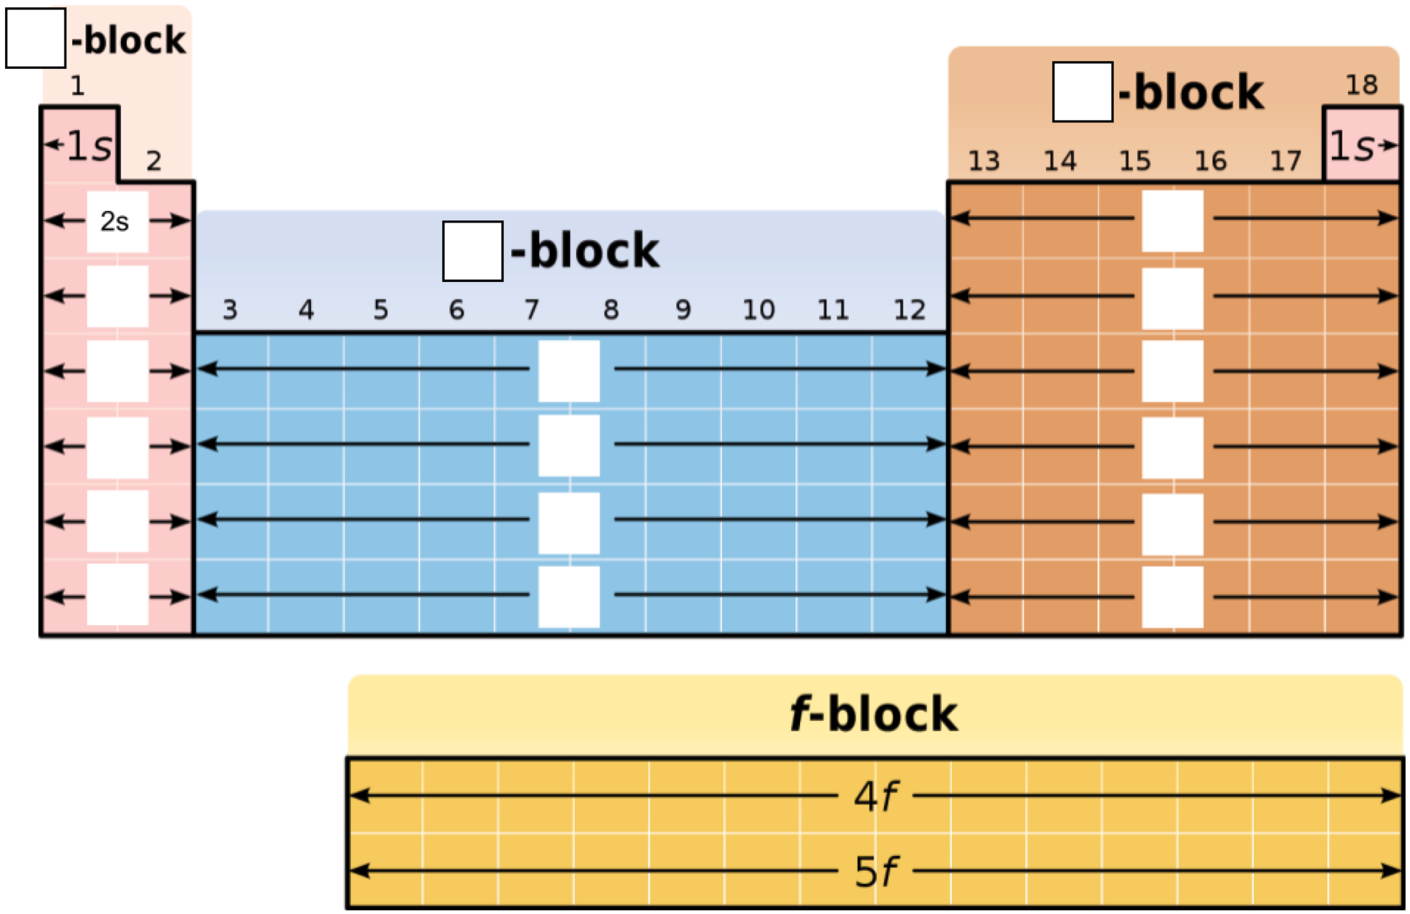
LOCK IT IN:
Identify the trend in atomic radii as you go right across a period and down a group by filling in the arrows below with the terms "increasing" or "decreasing".



OBJECTIVE 2

Demonstrate an understanding of how effective nuclear charge determines trends in atomic radii.

TASK 3: Using what you know about electron configurations, fill in the blanks with the orbital in which the last electron for indicated elements will be located. Notice how many columns are highlighted in each color to give you an idea of how many electrons can fit in that sublevel. You must also label each "block" of the periodic table with the correct orbital letter. The f-block has already been completed.

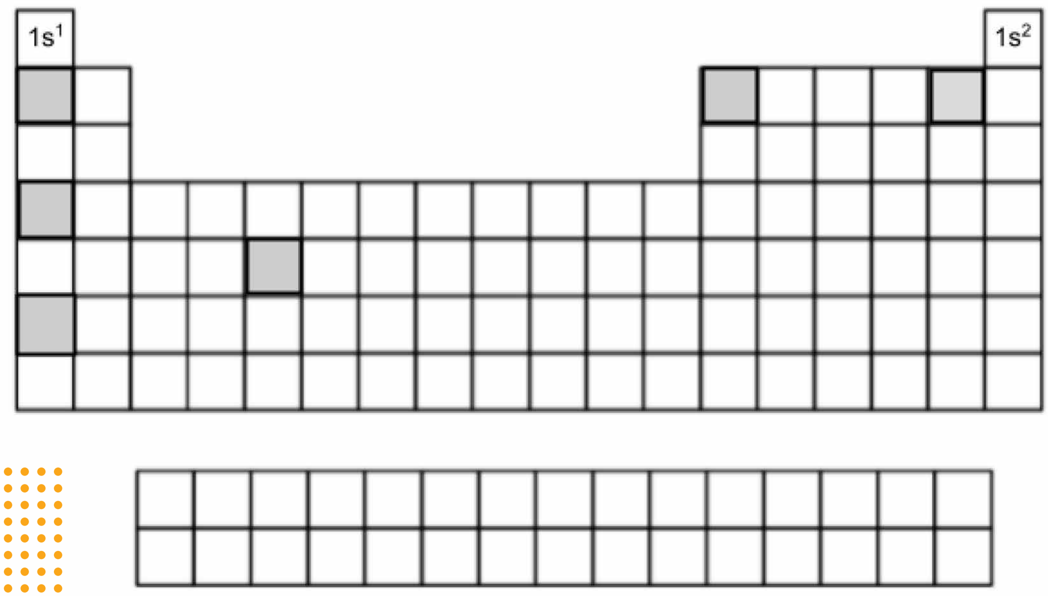


Periodic Table 2 by Roshan220195, CC BY-SA 3.0

OBJECTIVE 2

Demonstrate an understanding of how effective nuclear charge determines trends in atomic radii.

LOCK IT IN:
The periodic table can also be used to determine electron configuration. Fill in the highlighted spaces on the periodic table with the location of the last added electron in a ground state atom of that element. You will notice that you have already created some in the sandbox. However, there are five new ones you will also need to create. Hydrogen and helium have been filled in so that you can see the proper formatting. Pay careful attention to the energy level in which you are putting your final electron while working in the sandbox.



OBJECTIVE 2

Demonstrate an understanding of how effective nuclear charge determines trends in atomic radii.

LOCK IT IN:
Create a nitrogen atom (Z = 7) and try skipping the first energy level by adding all of your electrons to the second energy instead. Explain why the **aufbau principle** prevented you from doing so.

____

____

____

____

____

____

LOCK IT IN:
Try creating the same nitrogen atom. As you start to fill the 2p orbitals, put two electrons together in the first orbital. Explain how this violates **Hund's Rule.**

____

____

____

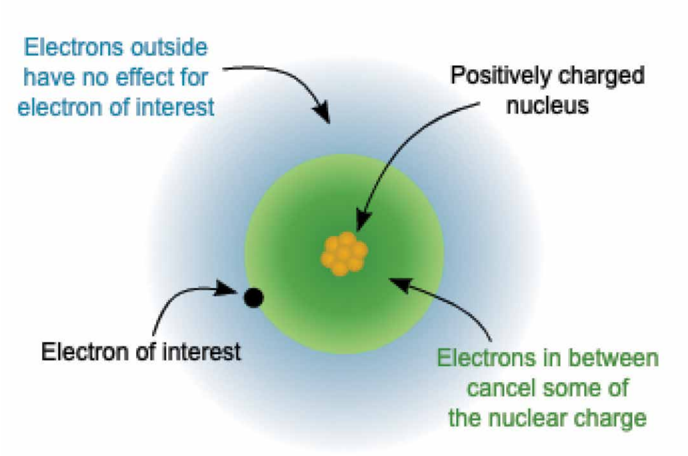
____

____

____

OBJECTIVE 2

Demonstrate an understanding of how effective nuclear charge determines trends in atomic radii.



Since all electrons share the same negative charge, repulsive forces help keep them generally separated. This effect is seen with “shielding”, which occurs when core (nonvalence) electrons reduce the **effective nuclear charge** or the attractive forces of the protons on the valence electrons. These electrons closer to the nucleus weaken the pull of the protons on the valence electrons and thus allow them to be more easily removed. Accordingly, increasing numbers of protons increases the effective nuclear charge on the valence electrons with only minor additional shielding as long as the added electrons are still in the same energy level. Addition of electrons in new energy levels increases shielding and thus reduces the attractive forces of the protons on the valence electrons even further.

Consider the concept using the image of periods 4 and 5 of the periodic table below. Of the indicated elements, krypton (Kr) with its 36 protons has a larger effective nuclear charge on its valence electrons than chromium (Cr) which has a larger effective nuclear charge on its valence electrons than potassium (K). The effective nuclear charge drops dramatically from krypton (Kr) to rubidium (Rb) despite the increased nuclear charge because the valence electrons are in a new energy level. However, note that in going down Group 1 the effective nuclear charge on the valence electrons of rubidium is slightly higher than that of potassium.

potassium 19 K 39.098	calcium 20 Ca 40.078		scandium 21 Sc 44.956	titanium 22 Ti 47.867	vanadium 23 V 50.942	chromium 24 Cr 51.996	manganese 25 Mn 54.938	iron 26 Fe 55.845	cobalt 27 Co 58.933	nickel 28 Ni 58.693	copper 29 Cu 63.546	zinc 30 Zn 65.39	gallium 31 Ga 69.723	germanium 32 Ge 72.61	arsenic 33 As 74.922	selenium 34 Se 78.96	bromine 35 Br 79.904	krypton 36 Kr 83.80

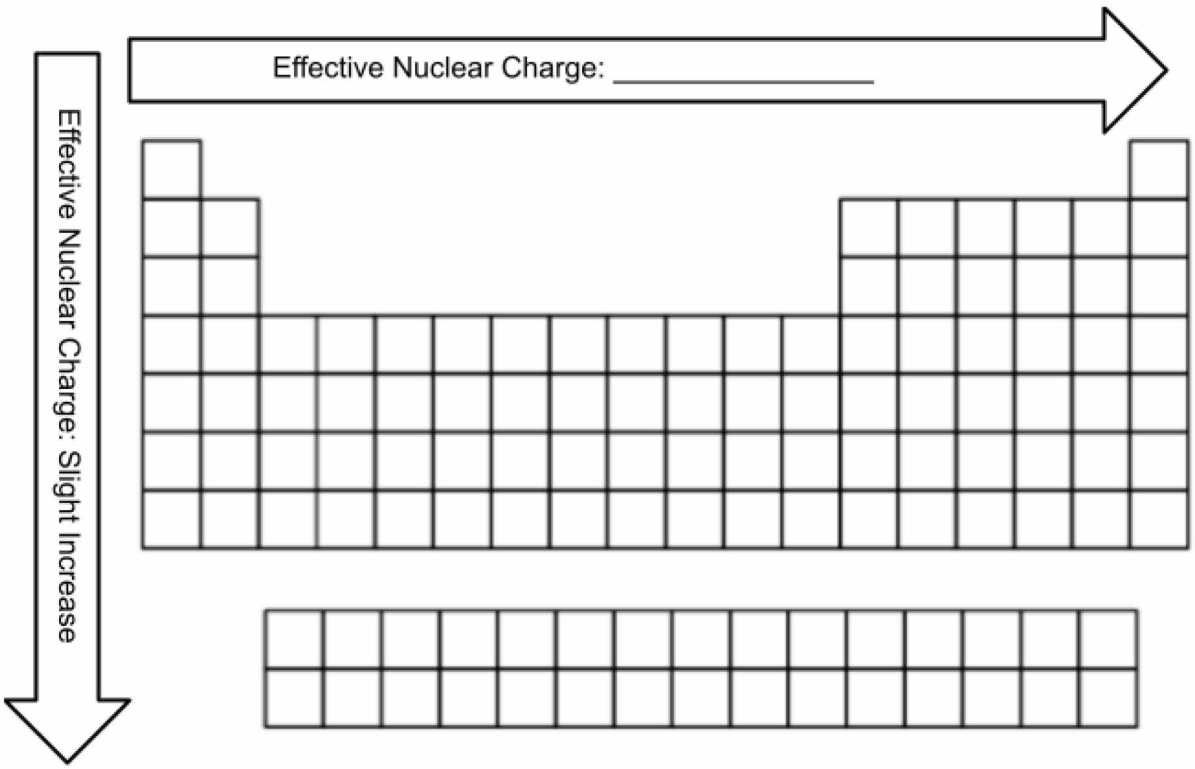
OBJECTIVE 2

Demonstrate an understanding of how effective nuclear charge determines trends in atomic radii.

Use the information from the text above to identify the trend in effective nuclear charge as you go right across a period by filling in the arrow below with the term “increasing” or “decreasing”.



LOCK IT IN:
Use the terms **“energy level”** and **“effective nuclear charge”** to explain why the trend you saw in atomic radius going right across a period is different from the one in going down a group.

____

____

____

____

____

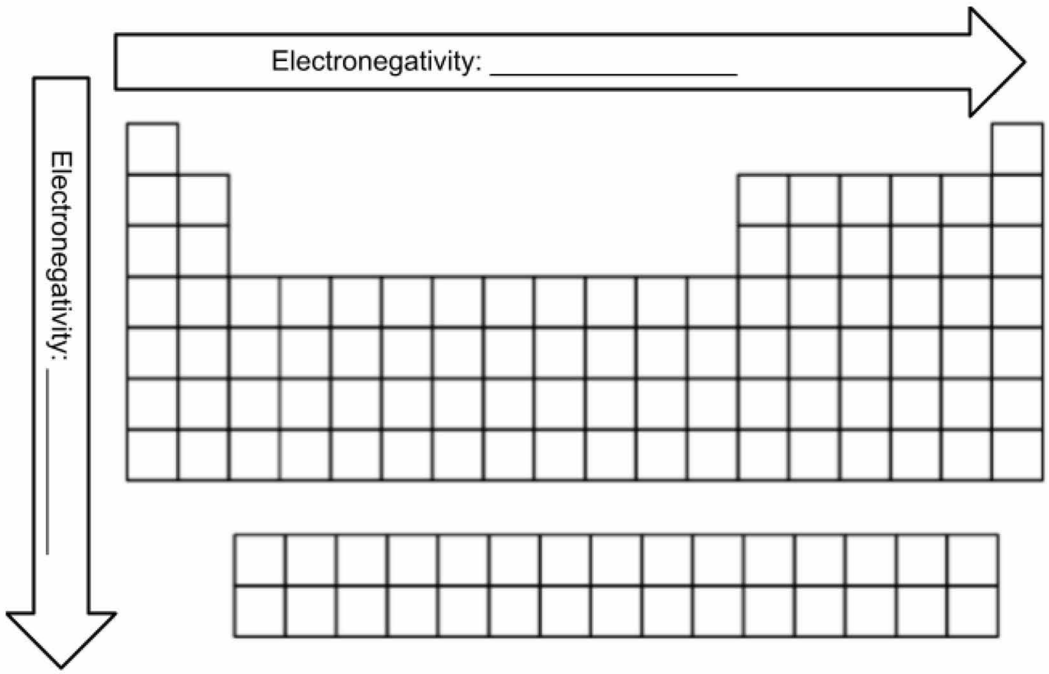
OBJECTIVE 3

Demonstrate an understanding of the periodic table trends in electronegativity.

TASK 4: Take a look at the six original atoms that you made in the sandbox for task one. You should notice a red glow around them that varies in strength. This glow represents the **electronegativity** of the atom. Electronegativity describes an atom's tendency to attract electrons when it is bonded to another atom. It will become very important in later tutorials but shows a clear periodic table trend. Order these five elements in order of increasing electronegativity in the spaces below.

__________ < __________ < __________ < __________ < __________ < __________

Least Electronegative | Most Electronegative



LOCK IT IN:
Identify the trend in electronegativity as you go right across a period and down a group. Fill in the arrows with the terms "increasing" or "decreasing". Note that the last period does not follow this trend.

CLOSURE

CLOSURE: Compare the two atoms below (chlorine and magnesium) on their proton numbers, number of electrons, atomic radii, effective nuclear charge, and electronegativities using only a periodic table. Enter a greater than (>) or less than (<) symbol into the table. Then provide a brief justification as to why you chose the symbol you did using what you have learned. Once you have done so, create the atoms in the Sandbox to confirm your comparisons.

17 Cl	12 Mg

	> or <	Justification	Prediction Correct? (Y/N)
Proton Number		______________________________	____
Number of Electrons		______________________________	____
Atomic Radius		______________________________	____
Effective Nuclear Charge on Valence Electrons		______________________________	____
Electronegativity		______________________________	____
